

Bronto Skylift Telecontrol 2.0

New version of the existing Telecontrol System

Benefits

Faster communication, better uptime

Remote support , no engineer traveling costs

Works on latest networks

We have developed a new version of the existing Telecontrol System that works over the internet. It is available now to upgrade existing B3+ control system units. This is ideal for areas where 2G network coverage is not available. The upgrade package is complete and simple to install, it includes a new modem with special software plus the antenna adapter and an M2M SIM card for worldwide usage.

The internet based connection system is the same as in all the latest production units. Downtime is minimized in the event of a breakdown or for calibration of new components. It significantly saves maintenance costs since most problems can be solved using remote connection by Telecontrol.

Please contact us for more information and if your 2G network in the area is shutting down or you would like to get an upgraded connection method for better reliability and faster response time in problem situations.
